# Introduction

Authentication is the act of confirming that a user is genuine, and then allowing access to the components of OpenEyes permitted for that user. A range of information will be held by the system about the user, and this document gives detailed information about where that information is held, and how much is editable either by the user, or the system administrator. Once the login process has finished, OpenEyes will know all relevant information about the user, not only for security reasons, but also to assist intelligently the user when performing data entry or retrieval.

## User Information

Information about the user is held in several tables within OpenEyes, as well as in external systems which, in large installations, OpenEyes will interrogate. A large organisation such as a hospital will already have an established system for authentication. It is desirable for OpenEyes to make use of this, in order to avoid the duplication of effort and user confusion that might arise with a separate system for usernames and passwords. However, the Role Based Access Control system (RBAC) used by OpenEyes requires a level of detail that may not be present in a simple authentication system. Finally, detailed information used, for example, for correspondence required a level of detail unlikely to be found in either the authentication or the RBAC system.

Figure 1 shows how user information is distributed between components of a large system, recognising that for small scale user installations, these entities might well be compressed into one, or at least be running on a single machine. Table 1 shows the suggested configurations for a range of possible installations based on scale. In a single user system, a much simpler scheme using a simple user and password table, with no need for RBAC would be appropriate.

Figure 1. Entity diagram showing the distribution of user information throughout systems in a typical large organisation.

Table 1. Example configurations for OpenEyes installations of different scales

| Setting        | Individual practise | Small department | Large department     | NHS Hospital         |
|----------------|---------------------|------------------|----------------------|----------------------|
| Users          | 1 - 2               | 10 - 20          | 50 - 100             | 200 +                |
| Authentication | OpenEyes            | OpenEyes         | LDAP server          | Active Directory     |
| RBAC           | None                | OpenEyes         | OpenEyes/LDAP server | OpenEyes/LDAP server |
| Details        | OpenEyes            | OpenEyes         | OpenEyes             | OpenEyes             |

## Logging On

This section describes the login process in detail, and how user information for OpenEyes is distributed throughout a large department or NHS hospital. A flow chart summarising the process is shown in Figure 2.

### 1. Login screen

The login process takes two pieces of information, a unique user identifier (UID) and password. The UID is a string with no constraints on its format or content, other than being unique (i.e. a user may call themselves almost anything they like)

### 2. Authentication

After the user has submitted the UID and password, the system interrogates the system server to check credentials. This can be done either within OpenEyes, within RBAC, or from an external system, such as active directory. If successful, it will then retrieve the consultant firms that the user is associated with (firms are stored as roles within RBAC). There is a complex relationship between consultant firms, clinical services, and specialties which is the subject of another document.<sup>1</sup> These are then offered to the user to choose before proceeding. Once the choice of firm has been made, the time and date of the login are stored.

### 3. Permissions

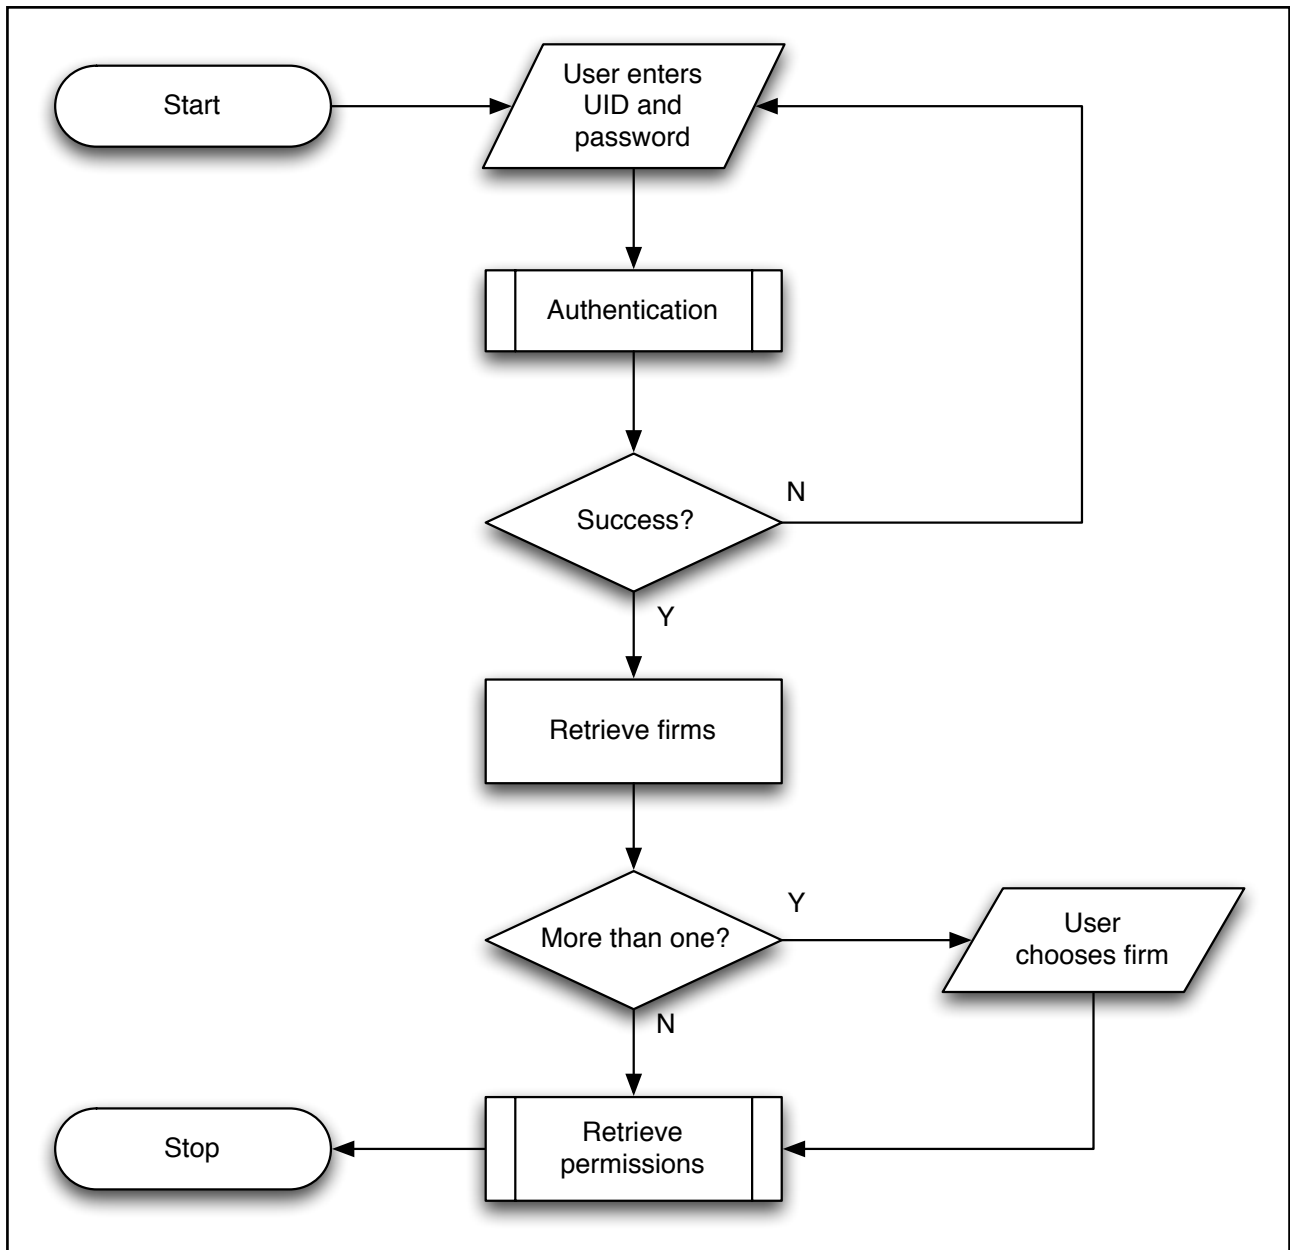

The RBAC system is then interrogated to retrieve all permissions associated with the user (according to their role). Permissions are stored as an array in a session variable, so are accessible for the duration of the logged in period. The clinical service, and specialty are also retrieved and stored as session variables, so that system choices are appropriately tailored to the user.

### 4. Retrieve additional user information

More detailed user information (such as description, title, address, email and telephone numbers) are then retrieved from the OpenEyes database. Much detail (for example addresses, telephone numbers, and email are identical to external contacts, so are appropriately stored in the contacts table. All user related data within OpenEyes is linked by the numeric user\_id field.

Figure 2. Logging on flowchart

## User Information

Very few assumptions are made about how an organisation stores information about users, so OpenEyes only expects a minimum set of information to be retrieved following the authentication component of the login process (Table 2)

Table 2. Minimum information set retrieved from a hospital wide system, such as active directory

| Item     | Description                           |
|----------|---------------------------------------|
| user_id  | Unique integer primary key            |
| uid      | User name as entered by user at logon |
| forename | First name of user                    |
| surname  | Last name of user                     |

Additional information about roles, in particular firms, services and specialties is obtained from the RBAC service, which also supplies a full list of permissions based on the user's role and what permissions have been assigned to that role.<sup>2</sup>

## Table Definitions

User information within OpenEyes is stored in the following tables, linked on user\_id;

Users Table:

| Field        | Type                                    | Comments   |
|--------------|---|--|
| user_id      | INT UNSIGNED NOT NULL<br>AUTO_INCREMENT | Primary Key, 4 billion                                       |
| uid          | VARCHAR(40) NOT NULL                    | uid in the external authentication database (eg LDAP)        |
| display_name | VARCHAR(40) NOT NULL                    | Full name used for display in output screens, and pick lists |
| contact_id   | INT UNSIGNED                            | Foreign key referencing contacts                             |

Contacts table:

| Field       | Type                                    | Comments  |
|-------------|---|---|
| contact_id  | INT UNSIGNED NOT NULL<br>AUTO_INCREMENT | Primary Key, 4 billion                                |
| paskey      | VARCHAR(12)                             | uid in the external authentication database (eg LDAP) |
| title       | VARCHAR(8)                              |   |
| first_name  | VARCHAR(20) NOT NULL                    |   |
| last_name   | VARCHAR(40) NOT NULL                    |   |
| degrees     | VARCHAR(20)                             |   |
| nick_name   | VARCHAR(20)                             |   |
| description | VARCHAR(40)                             | e.g. 'Vitreoretinal Fellow'                           |

| Field     | Type  | Comments   |
|-----------|---|--|
| company   | VARCHAR(40)   | Will vary according to type, but could be a Hospital name or an optometry premises |
| address1  | VARCHAR(40)   |  |
| address2  | VARCHAR(40)   |  |
| city      | VARCHAR(24)   |  |
| postcode  | VARCHAR(8)  |  |
| country   | VARCHAR(16)   |  |
| telephone | VARCHAR(24)   |  |
| fax       | VARCHAR(24)   |  |
| email     | VARCHAR(60)   |  |
| type      | ENUM("Consultant", "GP", "Optometrist", "Specialist", "Solicitor", "Other", "Social Worker", "Health Visitor", "Other") |  |
